

Week 4

Functional BFS traversal that returns a list of article names in between article X and Y. Some implementation of Cycle Detection (replaced Dijkstra's with this algorithm). A visual representation was added within the terminal. We also replaced the Landmark Algorithm we initially chose for Korsaraju's Algorithm. However, we found problems with parsing the category file later on and then some issues with cycle detection. To help with testing, we also added the option to pick specific functions to use in our main.cpp. The last things we needed to do is clean up the code and finish up logistics.
