Week 3

At this point over thanksgiving break, we fixed a few parsing issues. We also realized that substr in C++ is different then substring in java. We found a segfault that occurred in one of the vectors(numToVertex). We didn't take into account that vertex numbers can be in a random order (arrayoutOfbounds). Graph was now fully implemented with expected functionality. After Wednesday's lecture, we realized that Dijkstra's algorithm is used on weighted graphs when out data has unweighted edges.
